

## BPA Free Statement

All of iFillCup® pods are BPA Free. We take great care in making our products safe for our consumers. iFillCup™ Pods are made from polypropylene, a plastic which does not contain BPA. It is easy to identify single serve cups made from polypropylene. It is a soft, semi-cloudy plastic and typically has the recycle 5 symbol and/or PP on the bottom of the containers. All existing research maintains that polypropylene is safe.

## Frequently Asked Questions

### What is Bisphenol-A?

Bisphenol-A (BPA) is an industrial chemical used in the production of polycarbonate plastics. Polycarbonate plastic is commonly used to make consumer products. This type of plastic is clear and shatter-proof. It is commonly found in products such as water bottles, food storage containers, toys and many types of single serve pods NOT made by iFillCup®.

### What about the recycling numbers?

The recycling number is associated with the type of plastic used. Since most products are made using one of six resins, codes 1-6 describe a single specific type of plastic. Polypropylene for example is identified by recycling code number 5, and may contain the letters “PP” underneath.

Recycling code number 7 is slightly different because it stands for “other” which can encompass other single resins or a combination of resins. Polycarbonate, which contains BPA, carries recycling code number 7 as it is not one of the 6 as described above.

*All iFillCup™ pods have a recycling code labeled with recycling code number 5.*

***As the emerging leader in recyclable, single serve coffee solutions, iFillCup™ and iFillSystems™ by United Home Technologies, LLC. is committed to always doing what is best for consumers.***
